Project description:

Our game project is a 2D platformer game based on a telekinesis system. The main gameplay mechanic allows the player to move, lift, push, and throw objects using telekinetic powers instead of the usual weapons. The player controls the main character who has recently discovered their telekinetic abilities. The game focuses on interacting with the environment to solve puzzles, access new areas, and defend against enemies. The genre of the game is Action/Puzzle. Environmental elements include movable objects such as crates, rocks, doors, switches, and platforms. The player must use telekinesis to progress through the game.

Game story:

The game begins with the main character waking up alone in a mysterious research facility with no memories. As they explore, they discover they have telekinetic powers, which are used to move objects, solve puzzles, and interact with the environment.

The player finds clues about experiments on people with special abilities throughout the facility. Levels include test chambers, labs, and security zones, with increasing challenges and obstacles. Enemies and environmental hazards require creative use of telekinesis to progress.

The final goal is to escape the facility and uncover the truth behind the experiments, while mastering the character's powers.

(Subject to change)

Plan:Upcoming Weeks:

Refine telekinesis mechanics

Add player movement and camera control

Build simple test environments

Implement basic enemy interactions

Create multiple levels with increasing difficulty

Modify the story if needed

Checkpoint 02:

Working player controller

Basic telekinesis

One playable level with puzzles
